Inaugurated July 2003

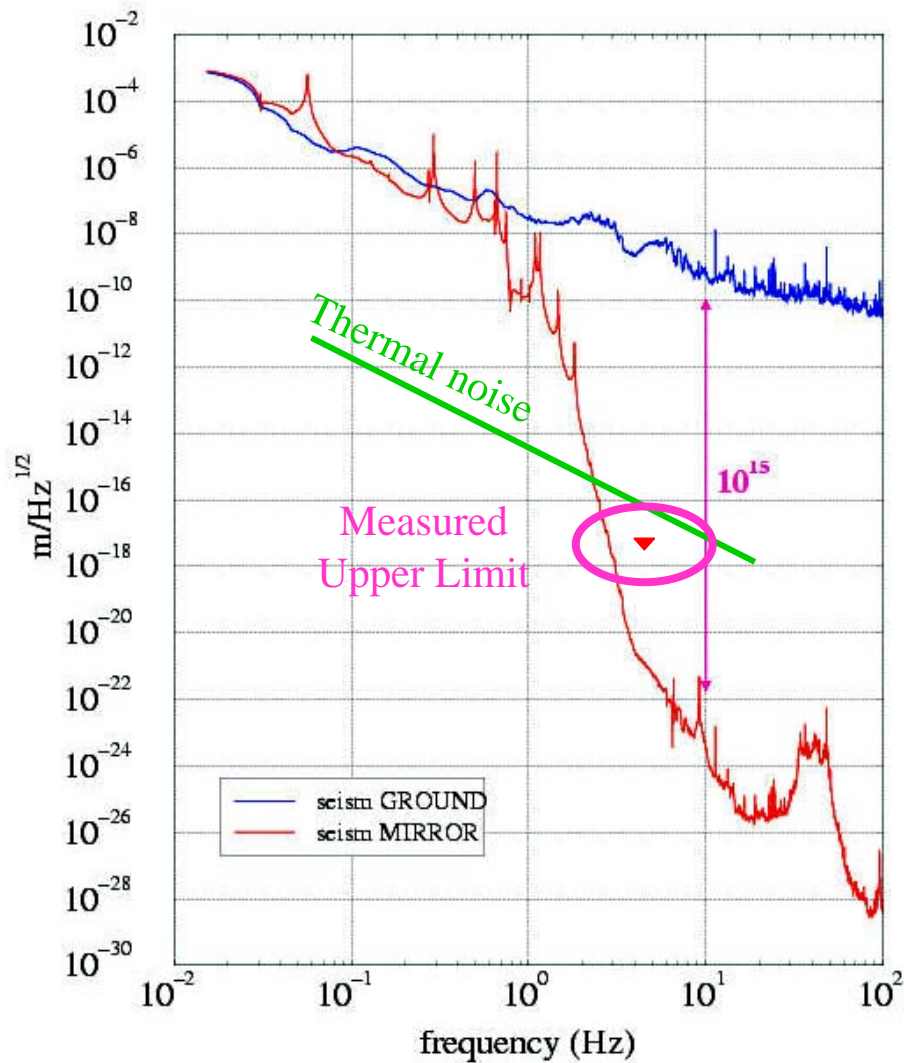

Sensitivity Goal

First attempt to extend the detection band down to a few Hz!

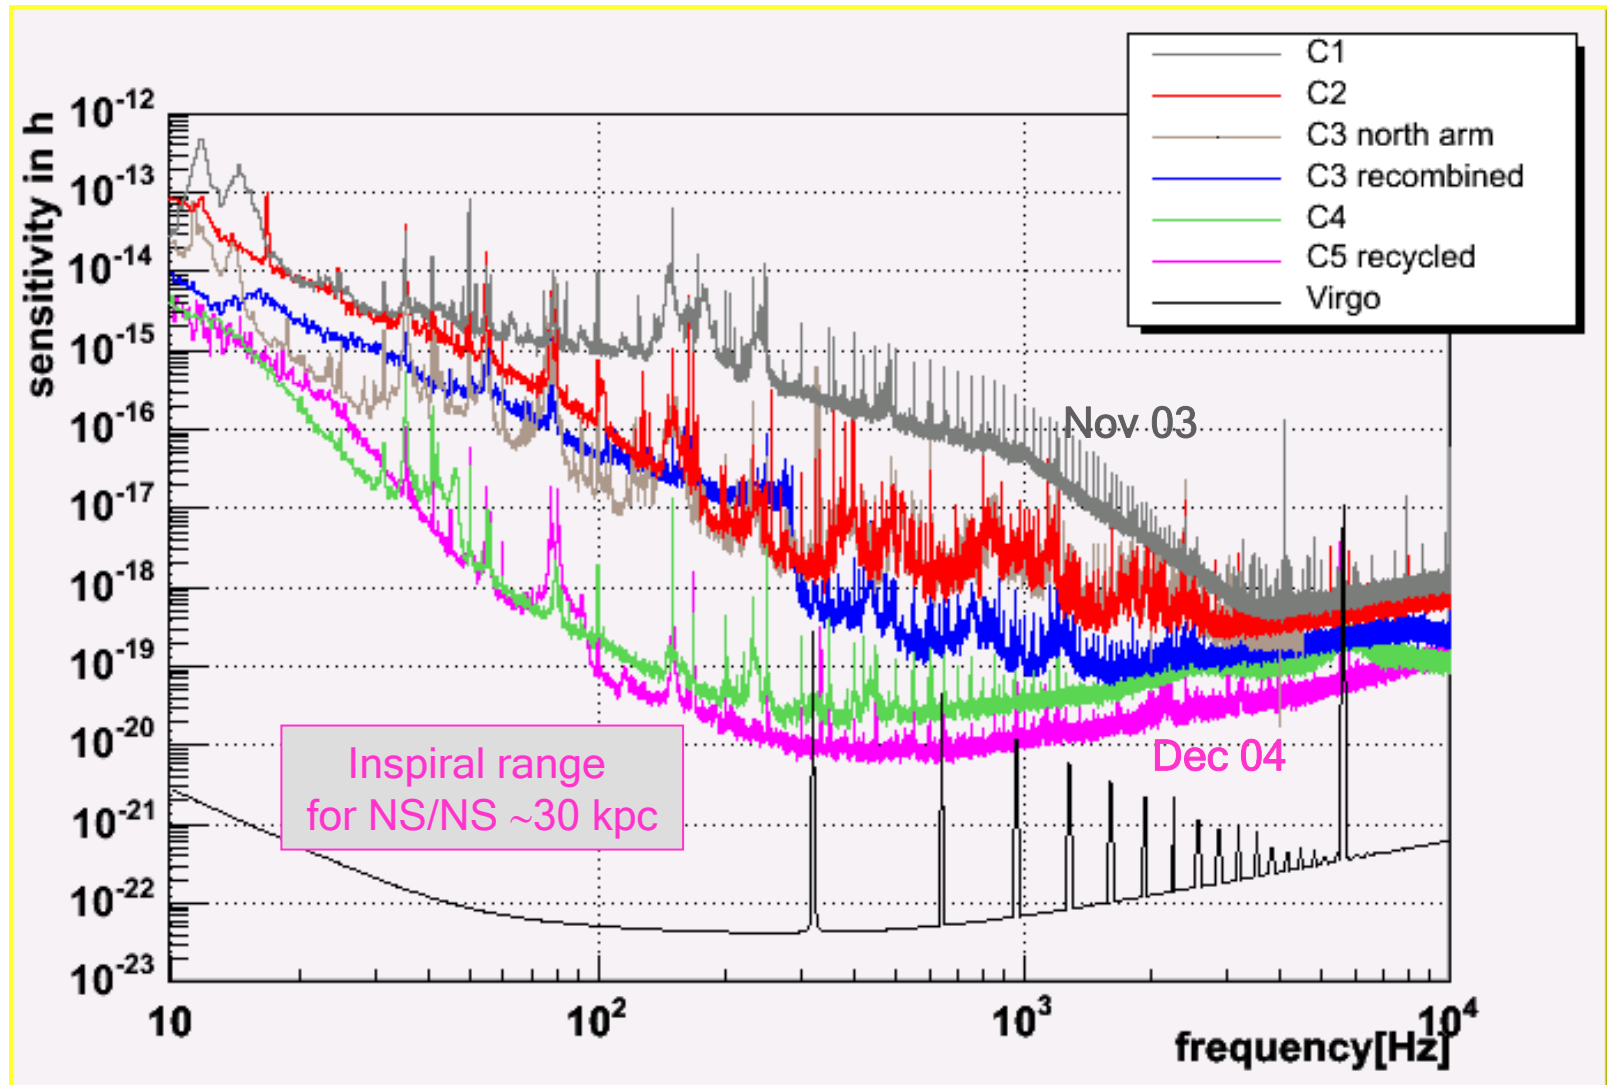

The superattenuator

A short summary

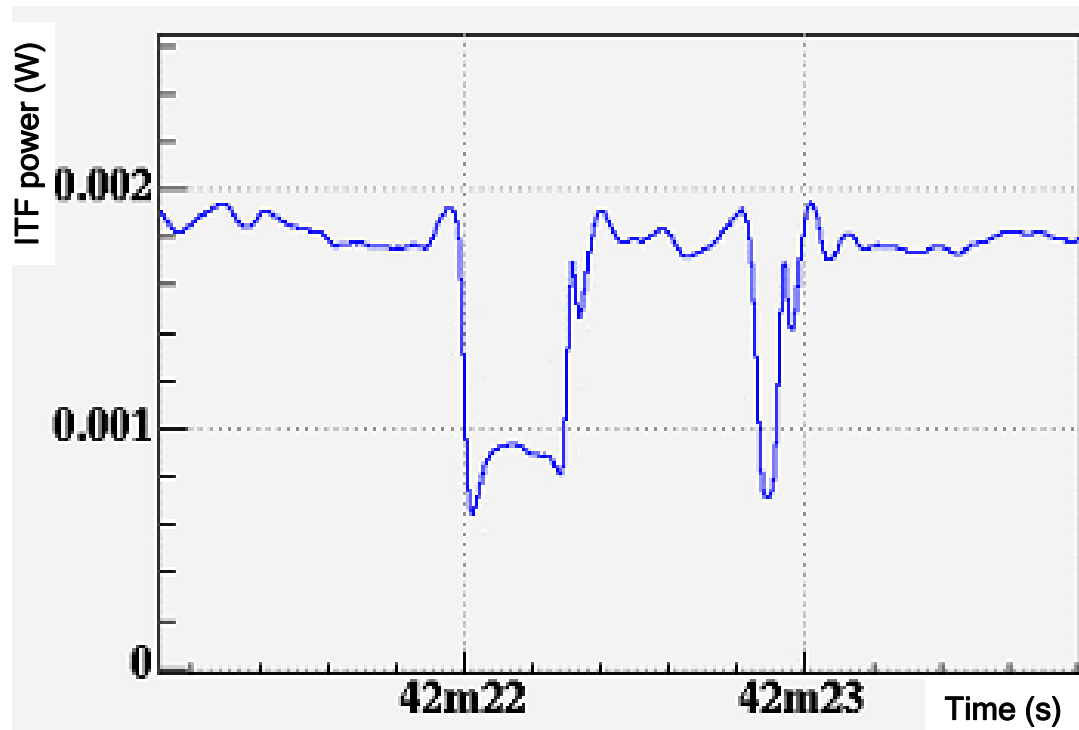

- **July 2003:** Inauguration. Start of full detector commissioning
- **February 2004:** first lock in “recombined” mode (Michelson+FP)
- **October 2004:** first lock in “recycled” mode
- **September 2005:** inspiral range for NS/NS >1 Mpc

ITF bistability

- **Jan-May 05:** commissioning slowed down by ‘jumps’
- Physical origin not fully understood. Solved after work on alignment, locking, detection

C6 and before
(June-July 05)

- ❑ Some ITF adjustments (injection bench alignment, tuning of demodulation phases, photodiode centering) allowed to get rid of the 'jumps'
- ❑ ITF stability improved by implementing angular drift control using wavefront sensing
- ❑ Low frequency control noise reduced by improving the locking driving matrix
- ❑ Locking procedure fully automated

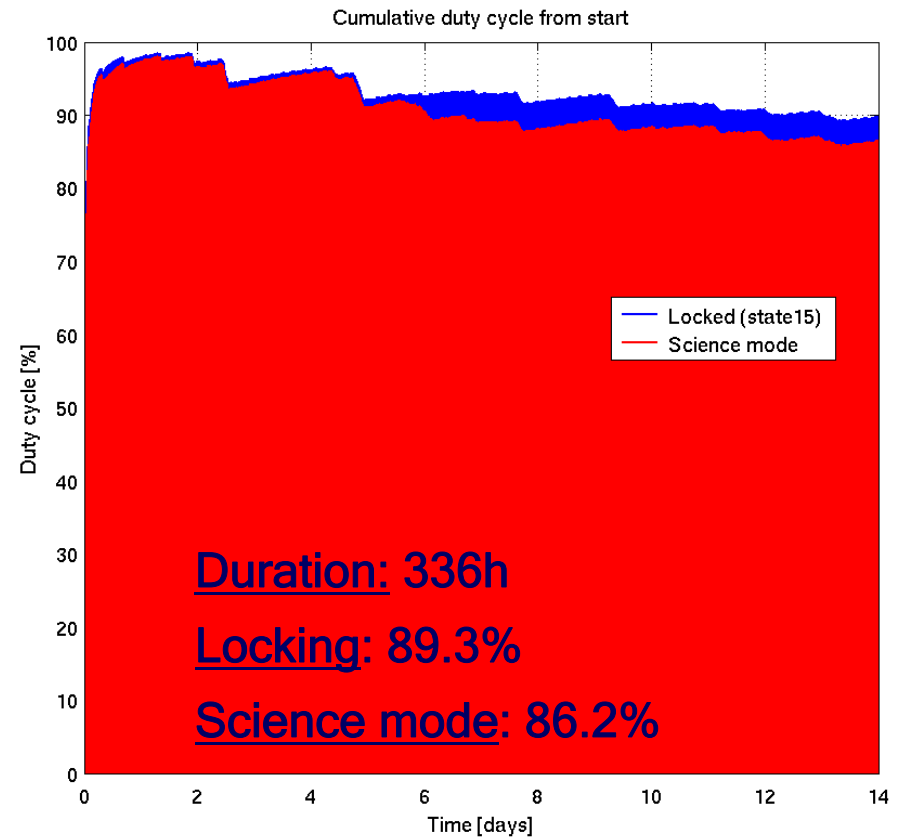

15 days run (29 July - 12 August)

Remarkable improvement in sensitivity and stability

C6 sensitivity

C6 stability

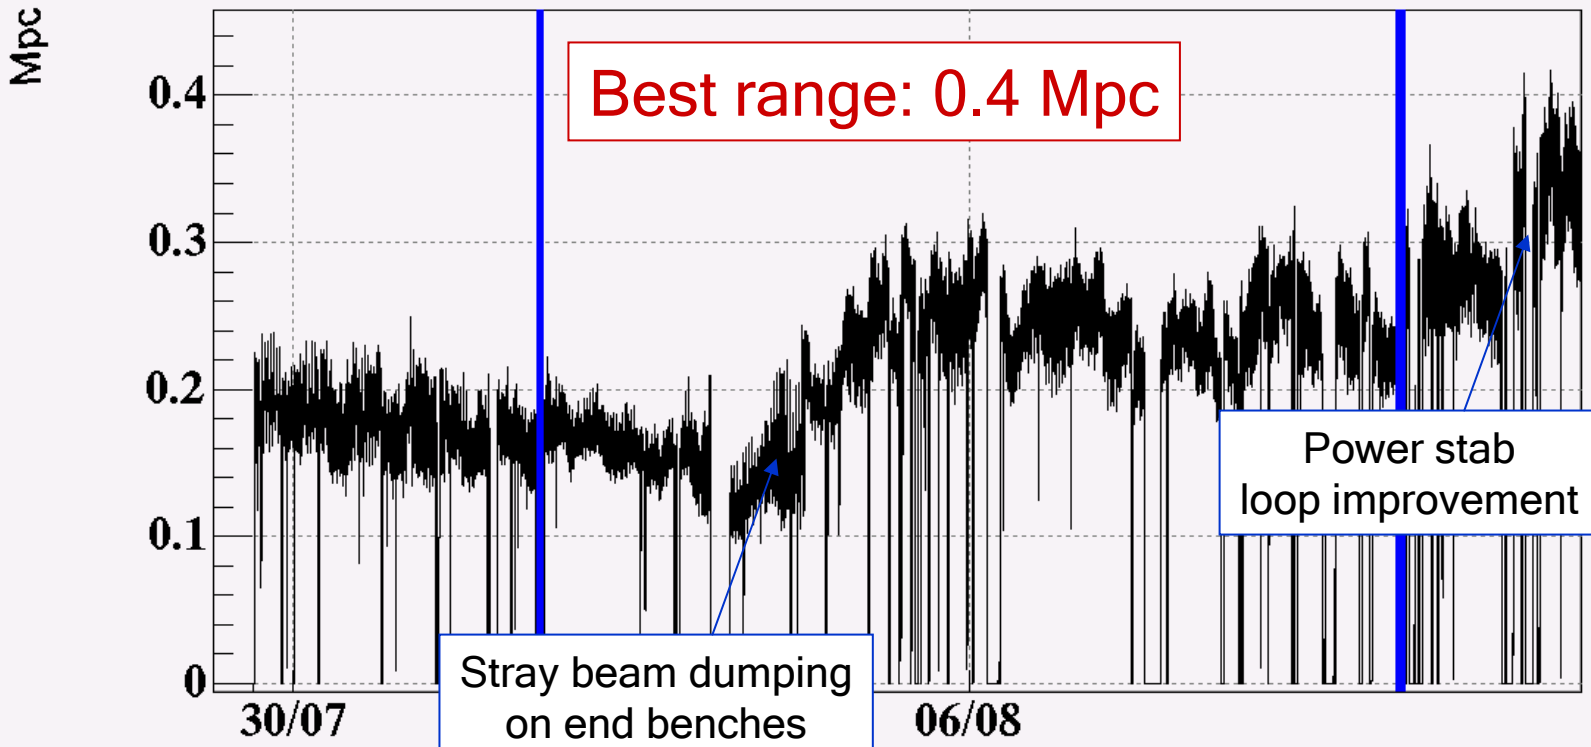

Longest lock stretch: 40 hours!

C6 inspiral range

Inspiral range for NS/NS: optimal orientation

Horizon_NSNS_TIME

on NE bench

C6 noise budget

Noise fully understood. Main contributions:

- Length/angular control noise
- Actuation (DAC) noise
- Frequency noise

After C6

(mid Aug-mid Sep 05)

Actions after C6

- ❑ Control noise reduction:
 - *Autoalignment fully implemented!*
 - Better length control noise rejection
 - Increase of modulation depth
- ❑ DAC noise reduction
 - *Full hierarchical control implemented (actuation over 3 stages)*
 - Low gain/noise coil driver
- ❑ Frequency noise reduction
 - More power on the photodiode providing the error signal

Important achievements:

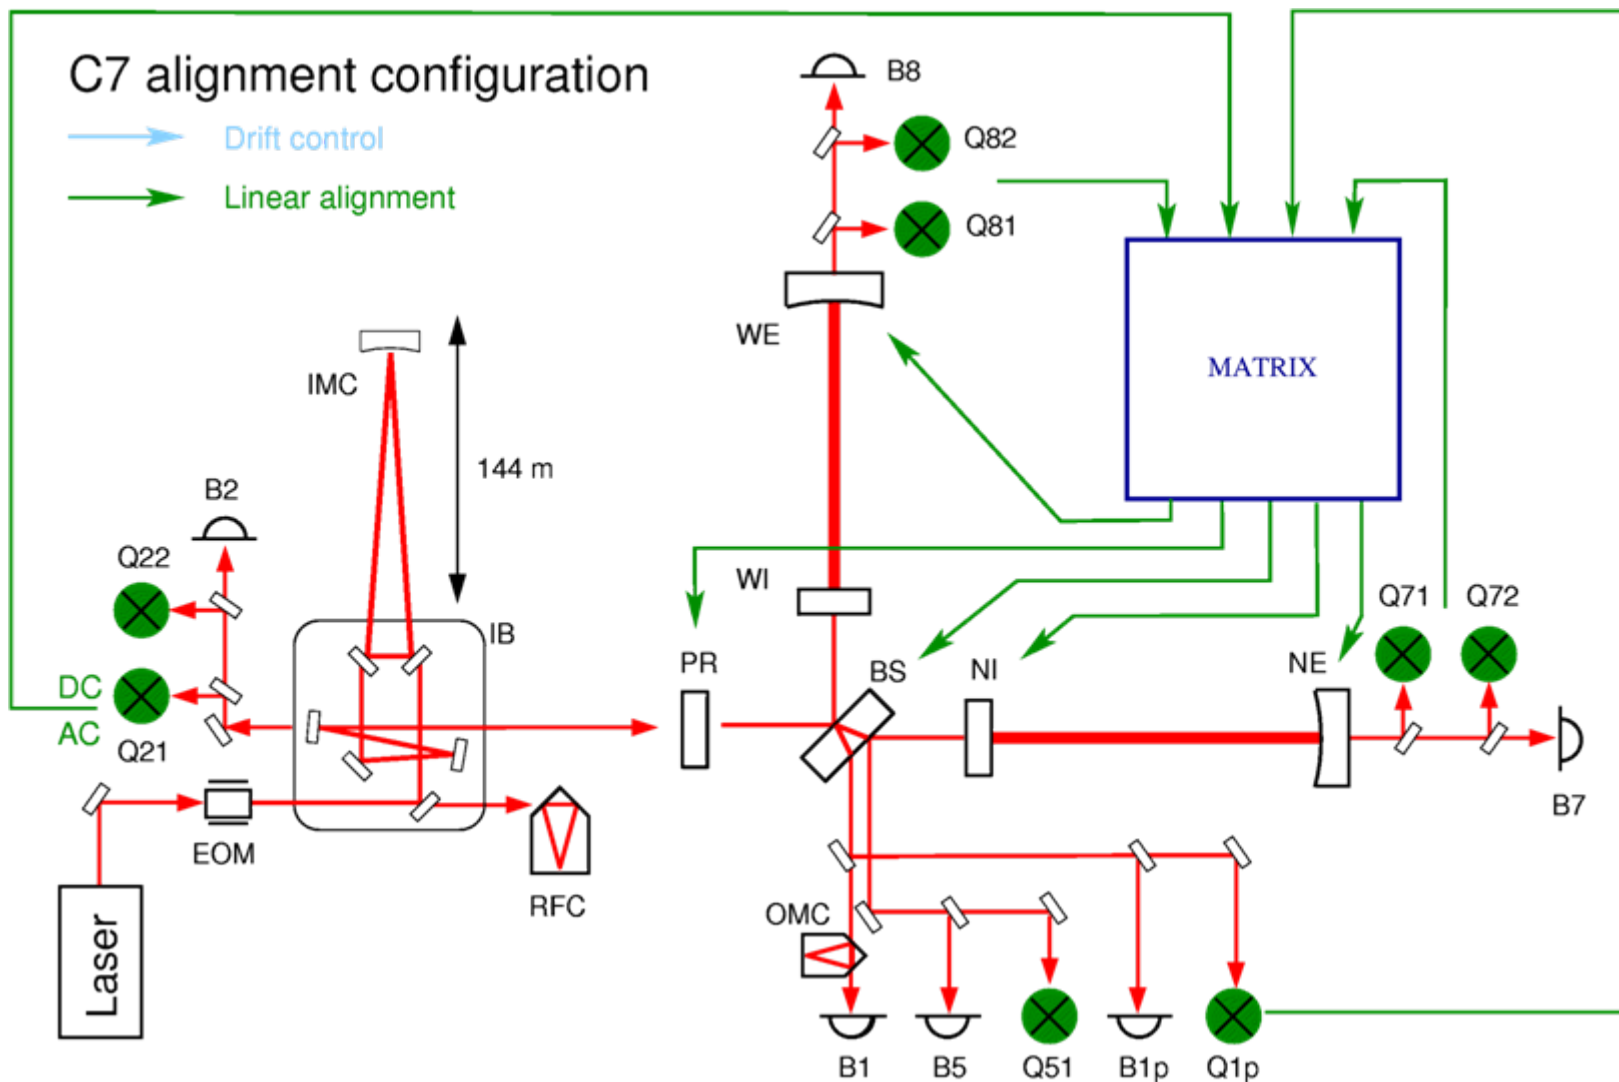

Anderson technique demonstrated

SA control design demonstrated

ITF left locked during night !

Autoalignment

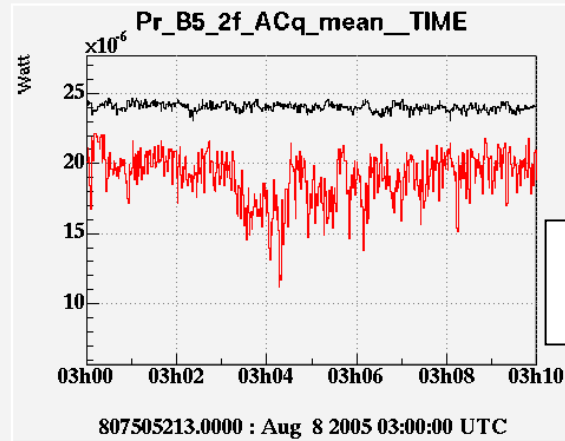

AA effect on ITF signals

Automatic alignment of NE mirror using wavefront sensing of output dark-fringe: **NO**, YES

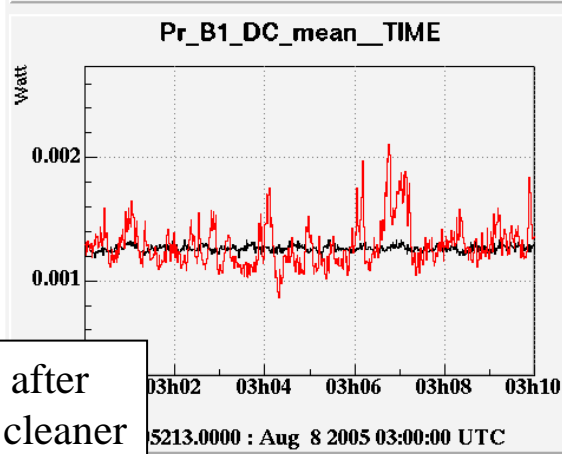

dataDisplay v9r08p1 : started by virgorun on Aug 25 2005 16:46:17 UTC

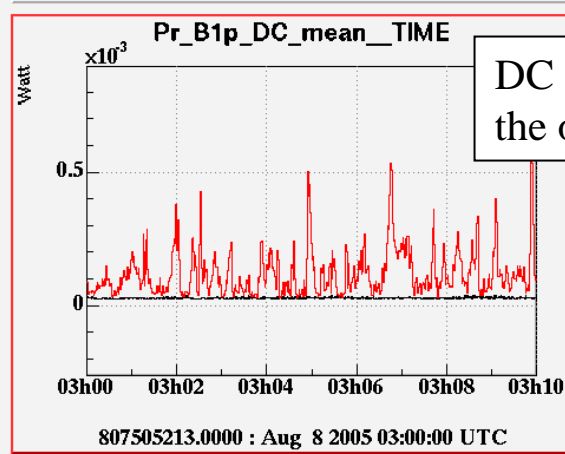

Pick-up of power recycling cavity power

Pick-up of Sideband power

DC output power after the output mode cleaner

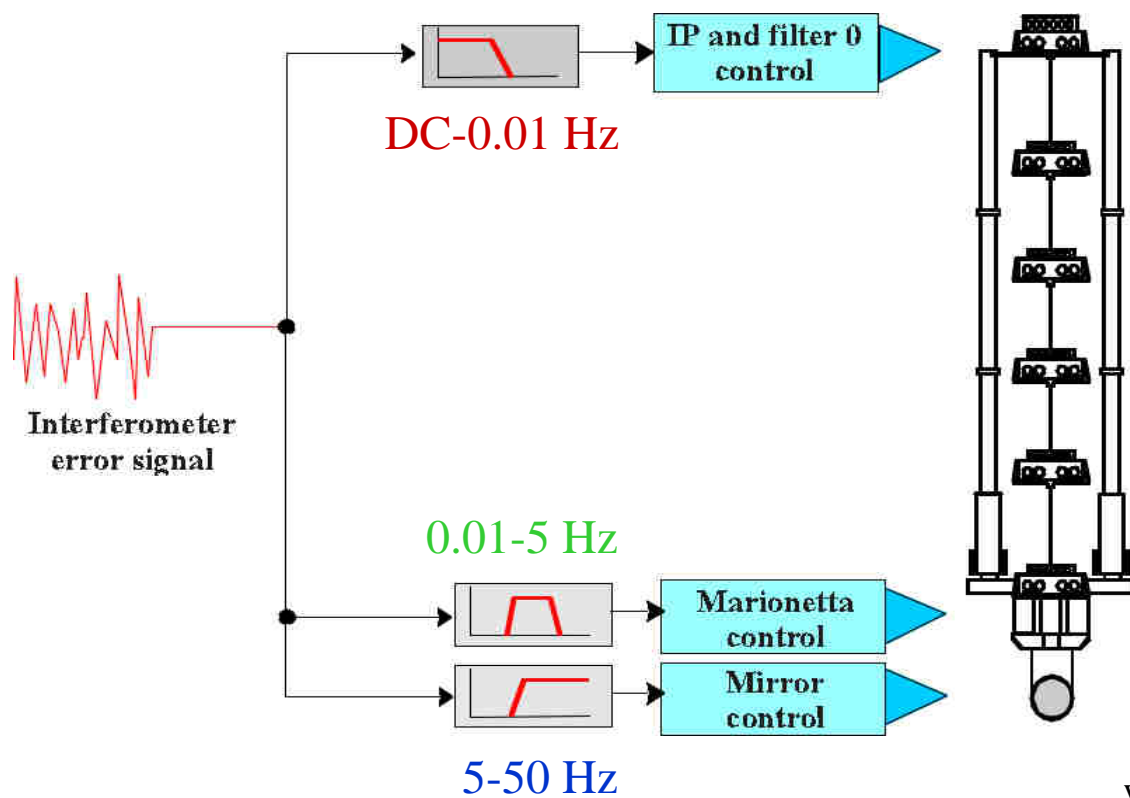

DC output power before the output mode cleaner

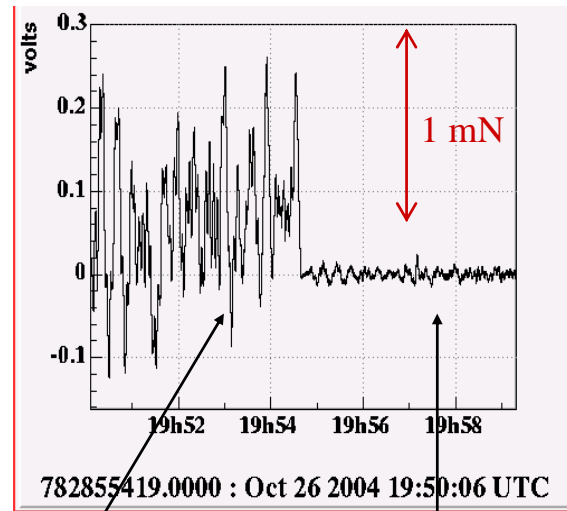

Hierarchical Control

- Limited dynamic range requires to split forces over more control stages
- Reducing the force on the mirror allows to reduce actuation noise

Force applied to the mirror with hierarchical control (same a.u.)

with tidal control

with tidal control & re-allocation to the marionette

zCorr reduction

- ❑ Marionette/RM crossover @5 Hz
- ❑ After reallocation zCorr rms reduced by ~100
- ❑ Allows switching to low noise coil driver (talk by A.Gennai)

Automation

The screenshot displays the 'Automation' software interface. On the left, a sidebar contains a list of automation modules: Alp, MainAlp, FdAlp, AlpAli, AlpCa, AlpDet, AlpSa, AlpGuard, AlpRecycled, and AlpLabView. The 'AlpRecycled' module is highlighted in yellow. A red arrow points from this module to a central menu. The menu lists various automation tasks, with 'Lock Step Request' highlighted in yellow. Another red arrow points from 'Lock Step Request' to a large window titled 'AlpRecycled - Lock Step Request'. This window shows a list of 15 lock steps, each with a numerical ID and a description of the step. At the bottom of the window, there are 'send' and 'close' buttons.

C7 run

- ❑ Many new features implemented, good sensitivity improvement
- ❑ NS/NS inspiral range beyond Andromeda
- ❑ New run decided before ITF scheduled shutdown
- ❑ **C7: 14-19 September**

C7 vs C6 sensitivity

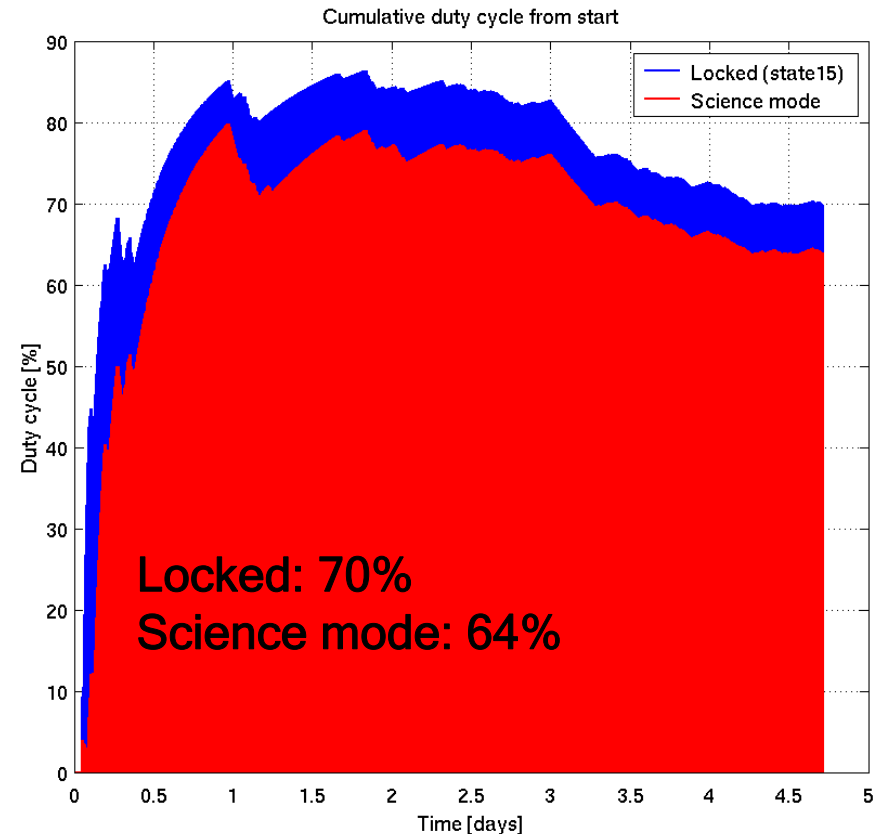

C7 duty cycle

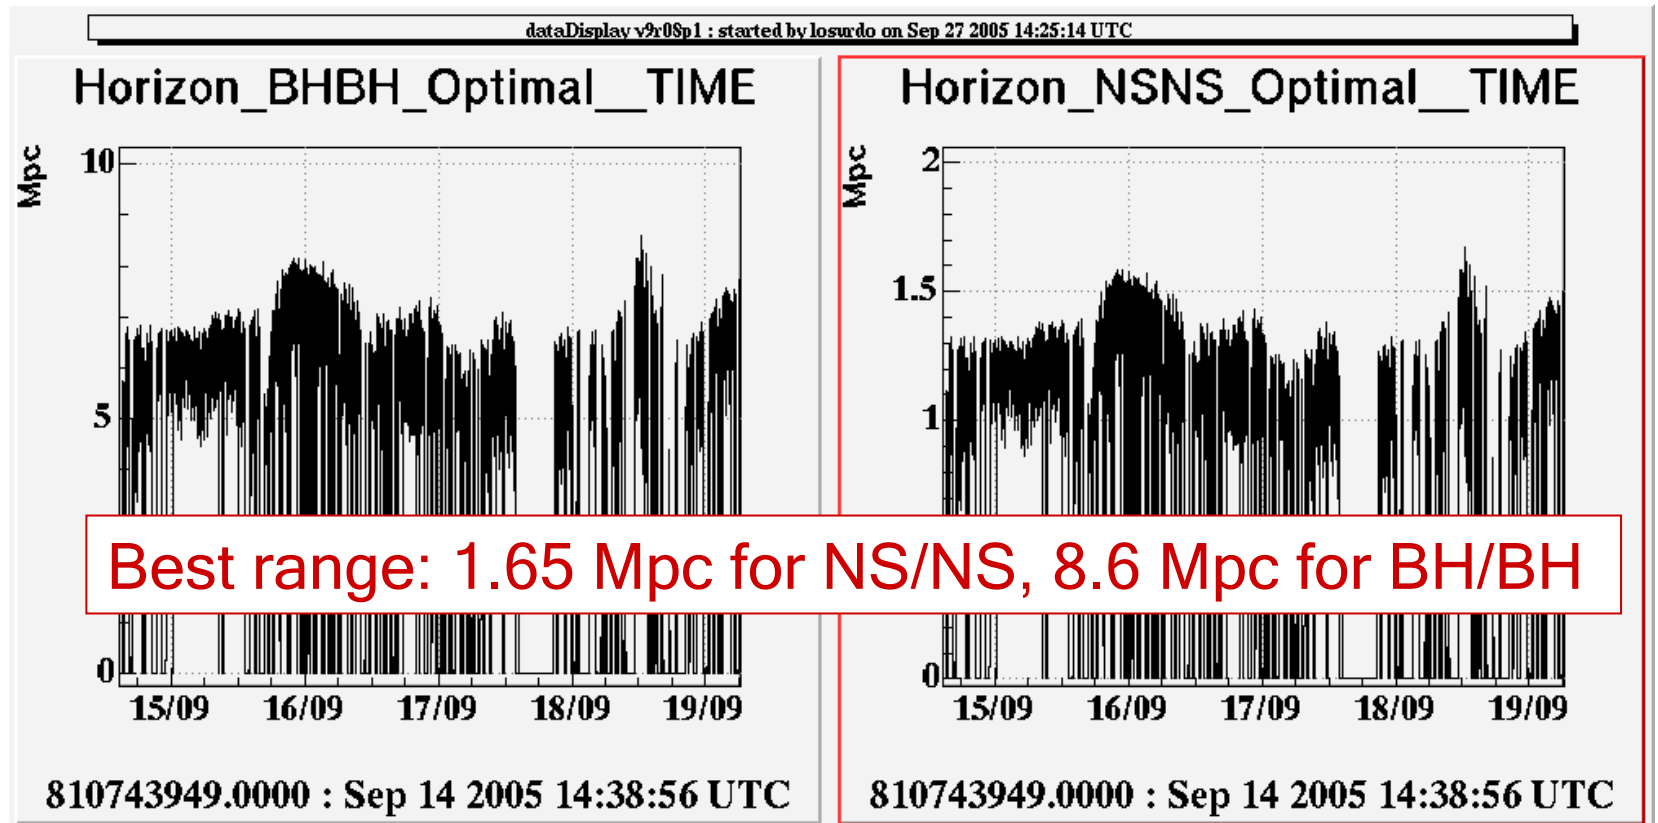

- Too many improvements in a short
- ↓
- A couple of stormy days

duty cycle worse than C6

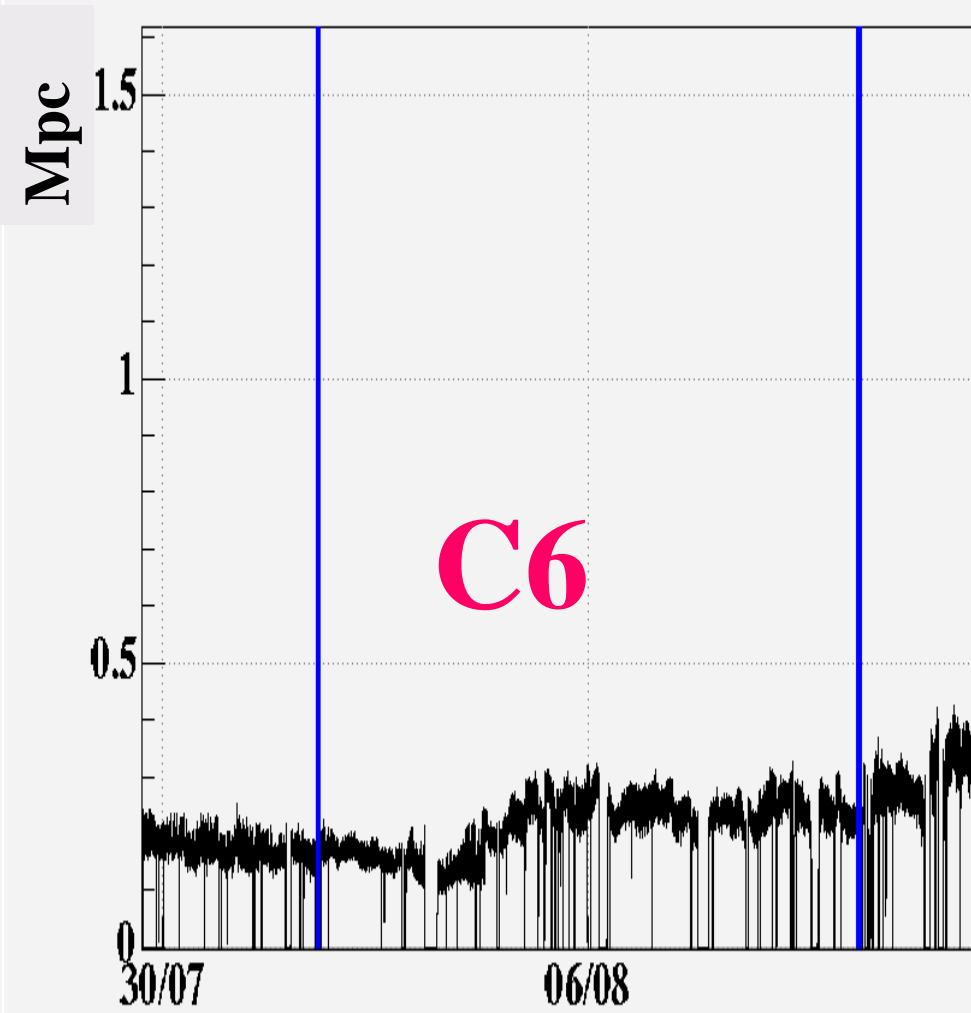

...though still good

C7 inspiral range

DA commissioning

- Two online analysis for chirp detection running
- NS/NS events injected

Virgo Commissioning Runs Sensitivities

Ligo and Virgo sensitivities

Virgo upgrades (Oct-Dec 2005)

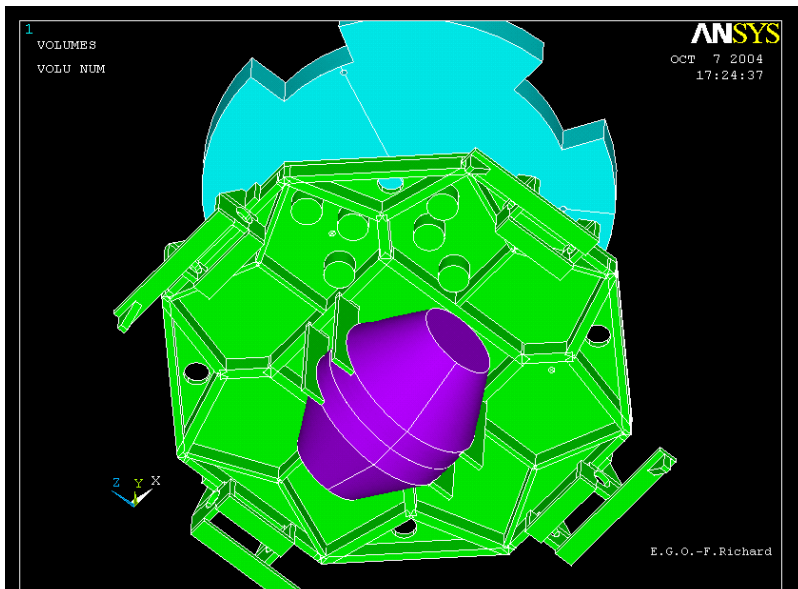

Problems with injection system

- A small fraction (bigger than expected) of the light reflected by the interferometer is retro-diffused by the input mode cleaner mirror: **spurious interference**
- Temporary solution: reduce the power ($/10$).
Virgo has been working with $P_{in}=0.7\text{ W}$
- Final solution: install a Faraday isolator
A new injection bench is needed.

Injection bench upgrade

- New bench:
 - Larger surface available for optics mounting
 - Higher rigidity
 - New wires
- Faraday isolator TGG (Terbium Gallium Garnet) produced by EOTec:
 - Compliant with 20 W laser
 - 40 dB isolation measured

Brewster dielectric polarizers

Rotator

PR mirror replacement

PR mirror: curved and compound

- Nasty internal resonances, very annoying for the locking
- Misalignments and jitter induced by translation

To be replaced with a standard flat Virgo mirror

PR transfer function

Optimal Horizon distance (kpc) NS-NS @ SNR=8
