

40m TAC Update

October 2006

The 40m Team

40 meter prototype

- Objectives:
 - Develop **lock acquisition procedure** of detuned Resonant Sideband Extraction (RSE) interferometer, as close as possible to AdLIGO optical design
 - **Test/Characterize LSC scheme**
 - **Develop DC readout scheme**
 - Characterize noise mechanisms
 - Test QND techniques
 - **Develop/Test ASC scheme**
 - **Extrapolate to AdLIGO via simulation**

Prototyping will yield crucial information about how to build and run AdvLIGO (and eLIGO).

**OMC Chamber view
from the North side** →

Work since last update (AugLSC)

- 1) DC Readout hardware installation
- 2) Mechanical tuning of the OSEMs
- 3) Mach Zehnder rework
- 4) Squeezing work
 - 1) translation stage busted; Go's drawing a new one

OMC

DC PD

From SRM

DC Readout I

- All in-vac hardware installed (~2 weeks open)
- Tested: OMC Length PZT, DC Photodiodes, OMC length locking (via temporary equip.)
- Initial alignment is good. OMC locked with decent visibility (~75% w/ no tip/tilt).
- Transmitted pickoff beam comes out of vacuum.

DC Readout *Issues*

- Encapsulated PD electronics vacuum nipple is leaky. Leak rate is ~1 liter/year. Better implementation is on the vent list.
- Confirmed that MC1/MC3 spots are off in yaw by ~15 mm, same as was measured a year ago. Re-alignment is on the vent list.
- **Pico Fiasco:** Using the Squeezer translation stage or the OMC's MMT Pico motors causes computers to crash and the MOPA to “wink out”. Seems like some kind of immense EMI problem...
- **AR Coatings:** Several of the CVI mirrors have none.
- **Beam Dumps:** Mostly neglected in the opto-mechanical layout. Black glass retrofit is on the todo list.
- **Various delays due to Piezo Jena.** Bottom line: *Let's never ever buy any Piezo Jena stuff again.*

40m Long Term Plans

- From the 40m conceptual design: “The primary goal of the 40 m upgrade is to demonstrate a control scheme for using (RSE)...”
- Also, from the same doc: “The 40m lab is a facility for the development, testing, implementation, and staging of small improvements to the LIGO interferometers”
- The 40m prototype should be used to inform the design and reduce the commissioning time in the Enhanced LIGO.
- Also cannot table the AdvLIGO ISC tasks that are on the 40m plate.

40m Long Term Plans

- http://lhocds.ligo-wa.caltech.edu:8000/40m/Long_Term_Plans_@_the_40m
- **DC Readout** (on a Michelson and then a PRFPMI)
- Develop the new AdvLIGO **LSC** Scheme
- **DC Readout on the DRSE** (w/ new LSC config.)
- **Advanced LIGO ASC** Scheme

DC Readout (Phase A)

- **Lock OMC Length Loop (w/ new controls)**
- Lock OMC Alignment Loops (dithering)
- **Characterize in-vac DC PDs (noise, TF)**
- **Simple Michelson displacement noise (DC v. RF)**
- **PRFPMI displacement noise (DC v. RF)**

Along the way, DWFs, Oplev filters, new CM servo

http://lhocds.ligo-wa.caltech.edu:8000/40m/Long_Term_Plans_@_the_40m

- **Re-establish the Full IFO locking**
 - » Mach-Zender has been reworked to stabilize the RFAM problems
 - » New MC servo is in so the frequency noise is better (hopefully)
- Some characterization ? What exactly ?
- **Adopt the new LSC Scheme (after one is chosen)**
 - » requires major in-vac overhaul for cavity lengths, finesses, etc.
- Prototype new style RFPDs (Grote/Sandberg style)
- Complex Modulation (to replace the Mach-Zehnder)

■ http://lhocds.ligo-wa.caltech.edu:8000/40m/Long_Term_Plans_@_the_40m

- **Goes along with the new LSC Scheme**
 - » New WFS circuits (because we don't have any WFS)
- This is a hard problem.

▪ http://lhocds.ligo-wa.caltech.edu:8000/40m/Long_Term_Plans_@_the_40m

DC Readout (Phase B)

- **Determine a set of measurements to do for this.**
- **Laser noise transfer functions, angular noise, scattering.**
- **Could also take this opportunity to install AdvLIGO CDS Infrastructure; provides some spares for iLIGO.**
