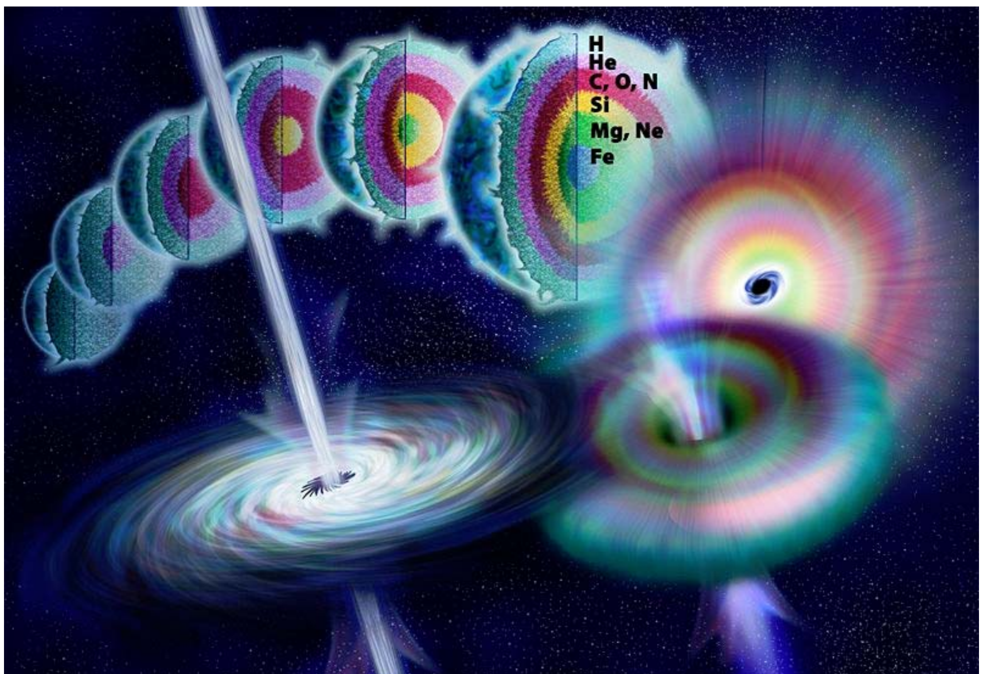
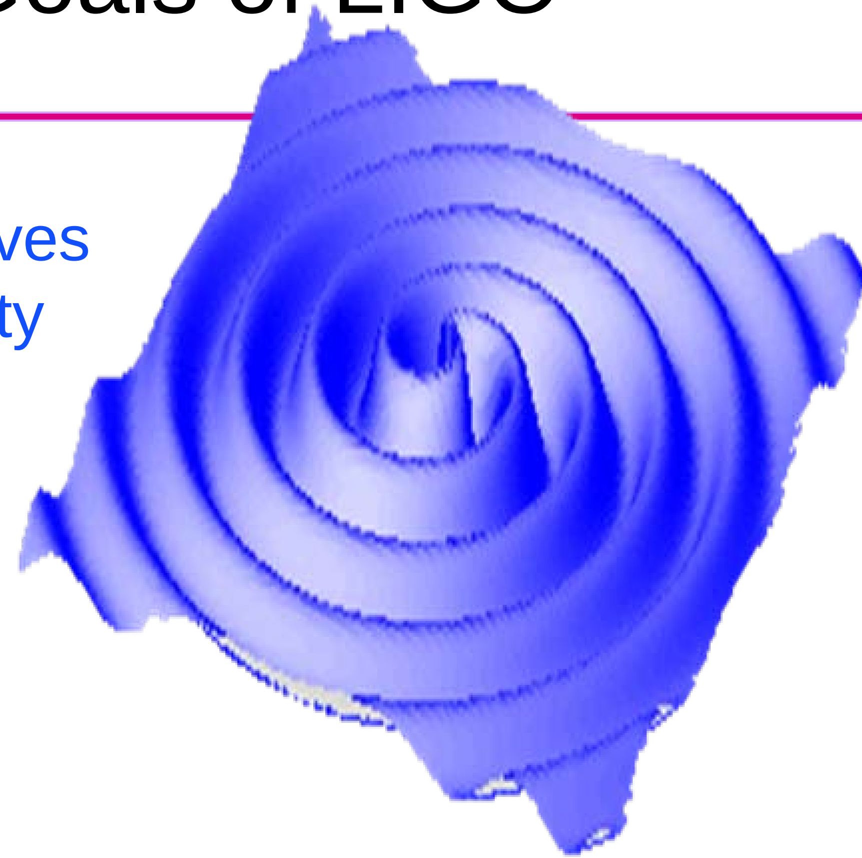
Scientific Goals of LIGO

- Discover the gravitational waves predicted by General Relativity





- Use gravitational waves to pioneer a new window on the universe

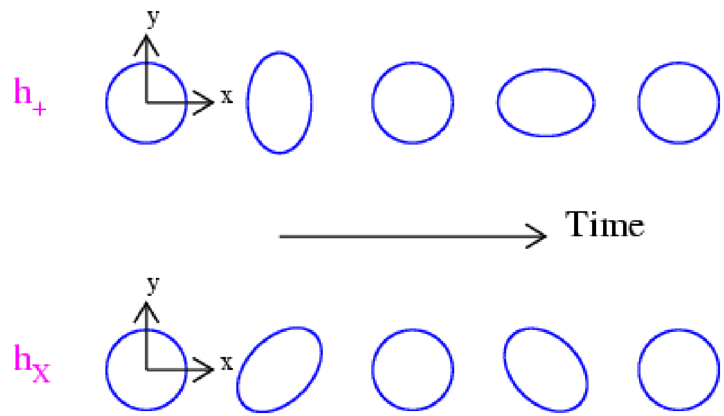
What is the observable effect?

Example:

Ring of test masses

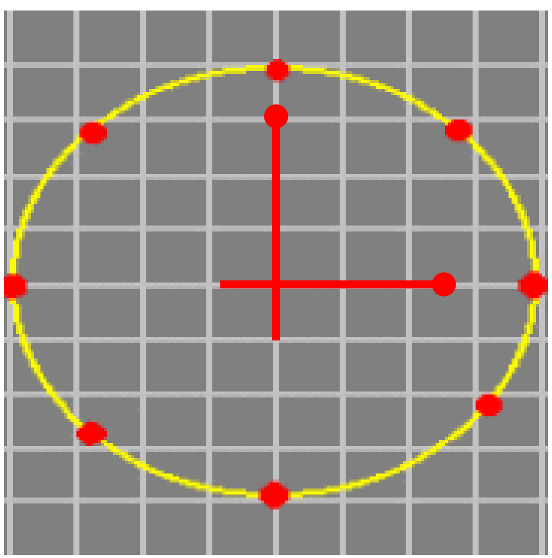
responding to wave

propagating along z



Amplitude parameterized by (tiny) dimensionless strain h:

$$h(t) = \frac{\delta L(t)}{L}$$

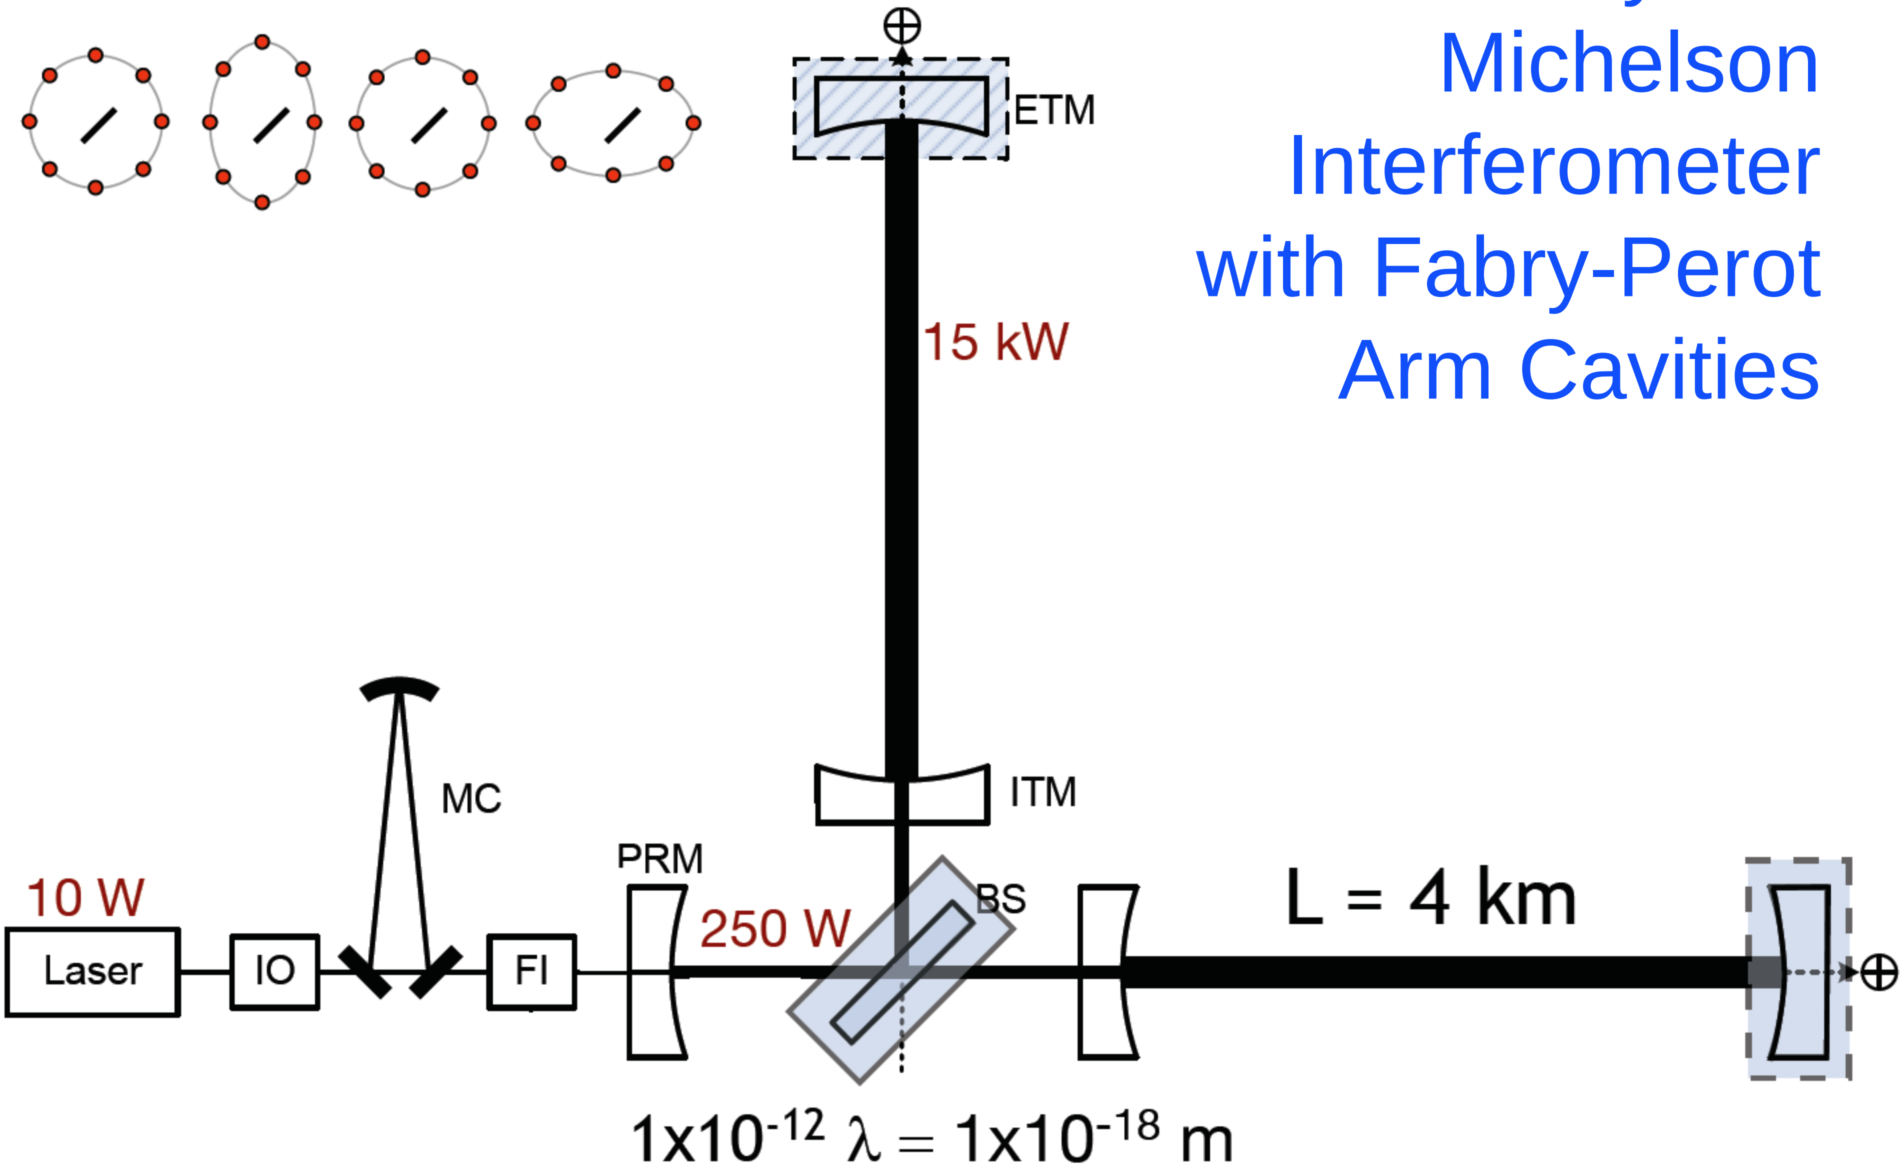


Arial View of the LIGO Sites

LIGO Hanford Observatory

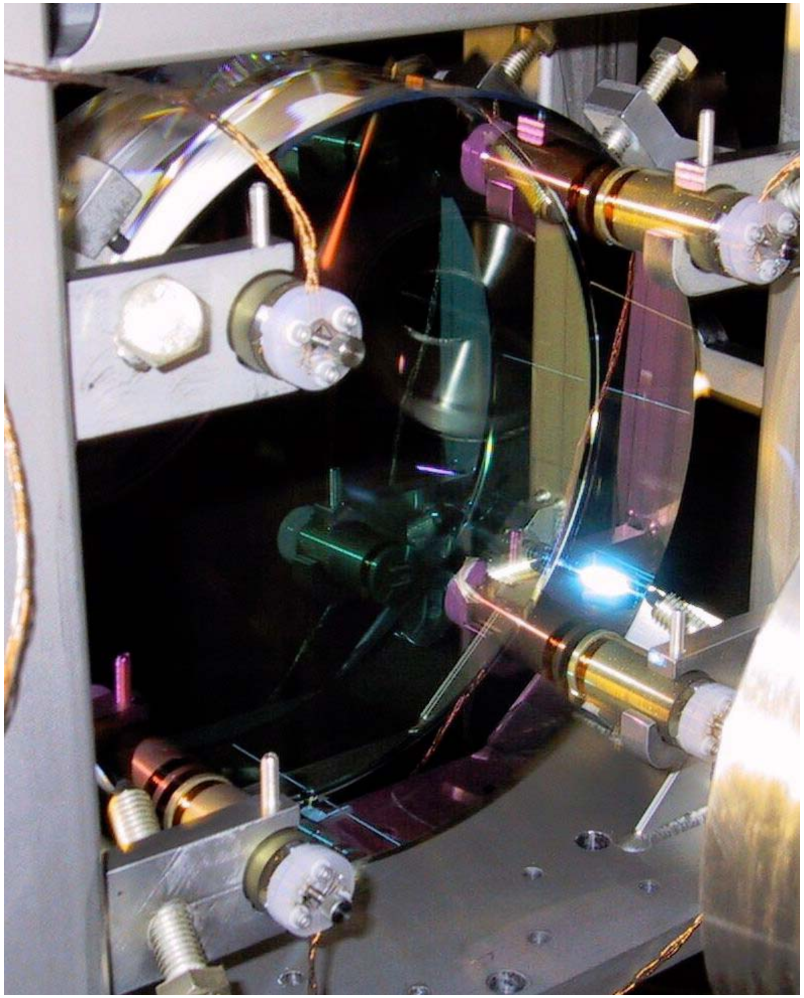
LIGO Livingston Observatory

Power-Recycled Michelson Interferometer with Fabry-Perot Arm Cavities



Main Features

- 4 km vacuum envelope
  10^{-9} torr
- Seismic isolation stack
- Suspended masses
- 10W Nd:YAG laser, 1064 nm
- Suspended mode cleaner
- Feedback controls for length and alignment
- Physical environment monitor



Strain Sensitivity of the LIGO Interferometers

GRB 070201

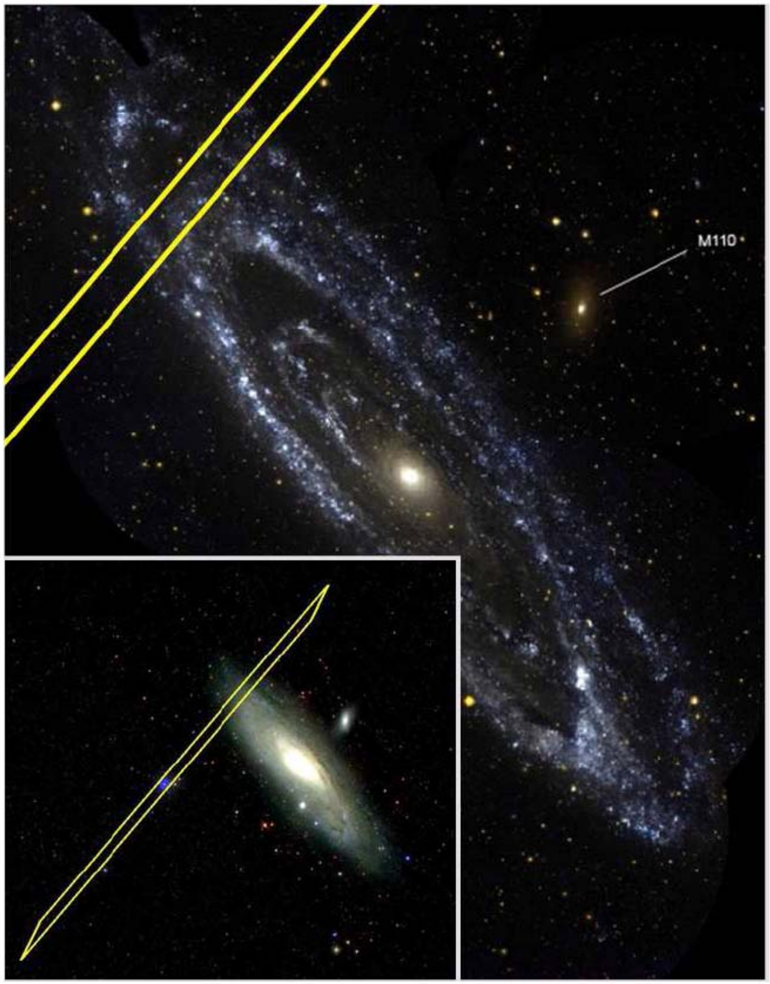

FIG. 1.— The IPN3 (IPN3 2007) (γ-ray) error box overlaps with the spiral arms of the Andromeda galaxy (M31). The inset image shows the full error box superimposed on an SDSS (SDSS 2007) image of M31. The main fi gure shows the overlap of the error box and the spiral arms of M31 in UV light (Thilker et al. 2005).

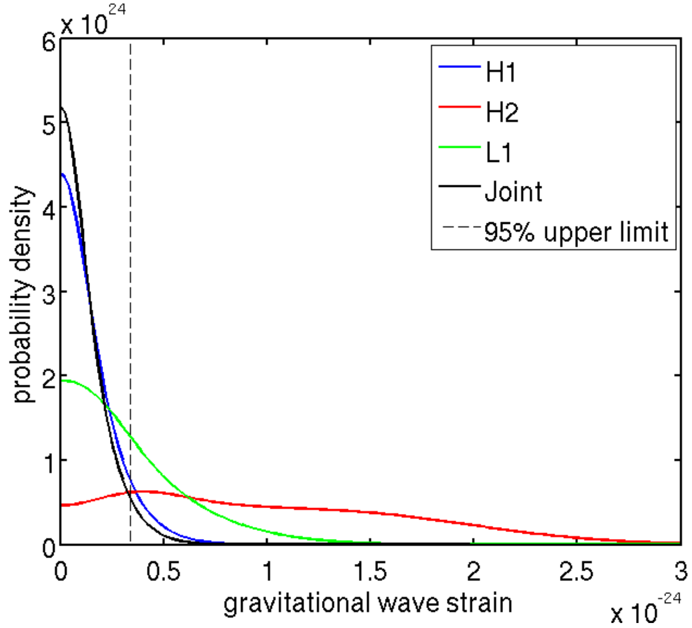
- Short, hard gamma-ray burst
  - A leading model for short GRBs: binary merger involving a neutron star
- Position (from IPN) consistent with being in M31 (Andromeda)
- LIGO H1 and H2 were operating
- Result from LIGO data analysis: **No plausible GW signal found; therefore very unlikely to be from a binary merger in M31**

Crab Pulsar

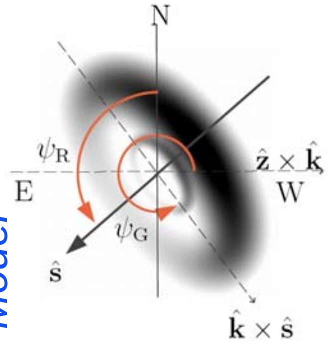
Result from first 9 months of S5:

Consistent with Gaussian noise



Chandra image

Model



Upper limits on GW strain amplitude h_0

Single-template, uniform prior: **3.4×10^{-25}**

Single-template, restricted prior: **2.7×10^{-25}**

Multi-template, uniform prior: **1.7×10^{-24}**

Multi-template, restricted prior: **1.3×10^{-24}**

Implies that GW emission accounts for ≤ 4% of total spin-down power

Search for a Stochastic GW Background

- Cross-correlated LIGO data streams to estimate energy density in isotropic stochastic GW, assuming a power law
- *Partial, preliminary* result from S5 is comparable to constraint from Big Bang nucleosynthesis

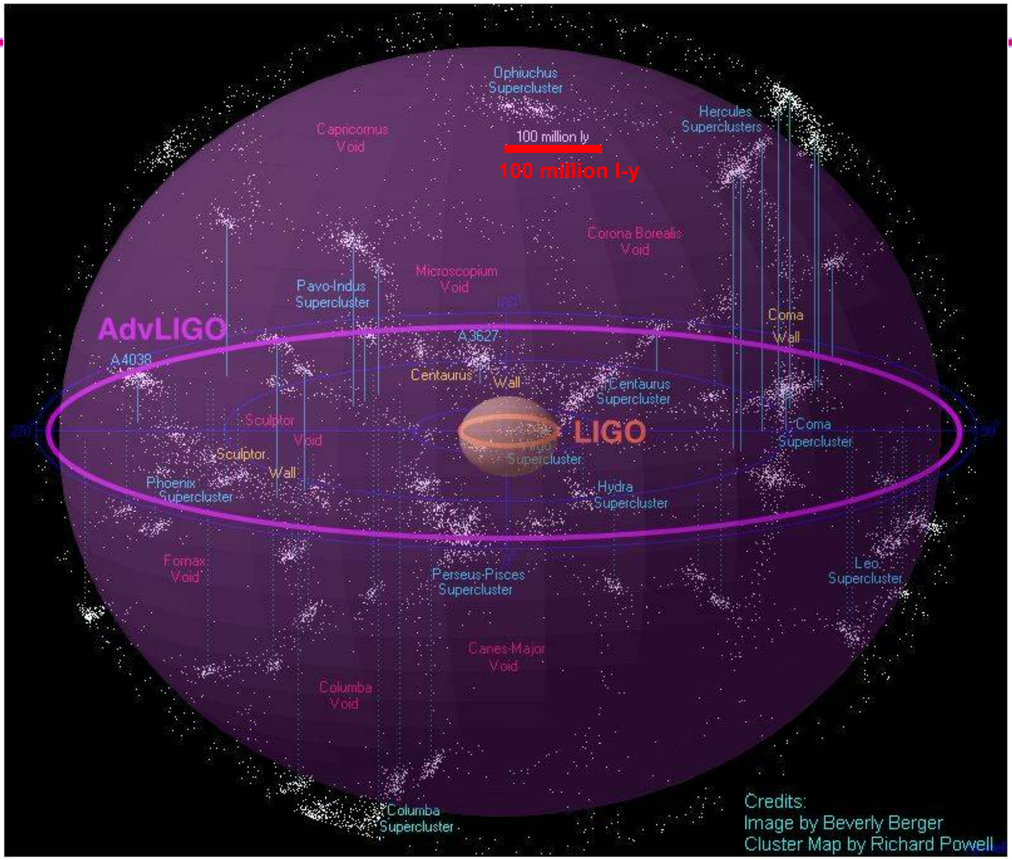
Key Technologies

- In-vacuum output mode cleaner
  - Currently installed and being commissioned
  - New advanced LIGO seismic isolation
- DC readout scheme
  - Crucial for advanced LIGO
- 30W laser (LZH/Hannover)
  - First stage of advanced LIGO laser
  - Will require bigger thermal compensation system
- Input optics
  - New high power Faraday isolator & Pockels cells
- New earthquake stops (fused silica tipped)

Advanced LIGO

- Funding approved at the beginning of this year!
- An order of magnitude improvement in sensitivity
  - 3 orders of magnitude improvement in rate!



Key Technologies

- Active seismic isolation system
  - Hydraulic pre-isolator
  - 2 stage in-vacuum isolation system
- Multiple suspension stages
- 30 kg test masses
  - Active thermal compensation
- 180 W laser source
  - High power input optics
- Signal recycling added
- In-vacuum detection benches

Summary

- First relevant science results are published!
  And more to come…
- All LIGO interferometers are at design sensitivity
- For sources like binary neutron star and black hole coalescence we can see well into the Virgo cluster
- The first big science run is done with 1 year of coincidence data
- Enhanced LIGO commissioning is in progress
- Advanced LIGO is funded

We should be detecting gravitational waves regularly within the next 10 years!
